

# Gregg Notehand Symbols

## Unlocking the Power of Rapid Writing: An Introduction to Gregg Notehand Symbols

In a world where information flows at an unprecedented speed, the ability to capture ideas quickly and accurately is invaluable. While typing has become the dominant mode of transcription, there remains a profound elegance and efficiency in handwriting—especially when that handwriting is powered by a structured shorthand system. Among the various shorthand methods developed over the past century, **Gregg Notehand Symbols** occupy a unique and practical niche. Designed not for the courtroom stenographer but for the everyday student, professional, and lifelong learner, Gregg Notehand offers a streamlined approach to note-taking that emphasizes readability, speed, and ease of learning. This article will explore the origins, structure, and enduring relevance of this remarkable system, showing you how these symbols can transform the way you capture and engage with information.

Many people hear the word "shorthand" and immediately think of complex, cryptic strokes that require years of dedicated practice to master. Gregg Notehand, however, was created with a different philosophy. It strips away the unnecessary complexity, focusing on a core

set of **Gregg Notehand Symbols** that are logical, phonetic, and surprisingly intuitive. Whether you are a college student trying to keep up with a fast-paced lecture, a professional seeking to make meetings more productive, or simply someone who loves to learn, understanding these symbols can be a game-changer. This article will serve as your comprehensive guide to the world of Gregg Notehand, covering its history, its core components, and practical tips for integrating it into your daily life.

## What Exactly is Gregg Notehand?

To appreciate the **Gregg Notehand Symbols**, it helps to understand the system from which they came. Gregg Notehand is a simplified adaptation of the much older and more comprehensive Gregg Shorthand system, invented by John Robert Gregg in 1888. The original Gregg Shorthand was a masterpiece of efficiency, capable of speeds exceeding 200 words per minute. However, its complexity made it a specialized skill, typically learned only by secretaries and reporters who needed extreme speed for verbatim transcription.

In the 1950s and 1960s, educators recognized a need for a more accessible system that could be taught in high schools and colleges to the general population. The goal was not verbatim speed, but rather a

practical increase in writing speed (to around 60-80 words per minute) while maintaining excellent legibility. The result was Gregg Notehand, published in 1960. The system uses the same basic principles as its predecessor—the use of curved lines, slant, and length to represent sounds—but it significantly reduces the number of rules, brief forms, and special symbols. This makes the **Gregg Notehand Symbols** much easier to learn and retain, even for someone who only has a few weeks to dedicate to the study.

## The Core Philosophy Behind the Symbols

Unlike some shorthand systems that are based on spelling (orthographic), Gregg Notehand is a phonetic system. This means that the **Gregg Notehand Symbols** represent the sounds of speech, not the letters of the alphabet. This is a critical distinction because it allows the writer to write by ear, bypassing the irregular spelling of English. For example, the word "rough" is spelled with a silent 'gh', but in Gregg Notehand, it is written based on the sounds "r-u-f." This phonetic foundation is what makes the system both fast and remarkably intuitive.

The symbols themselves are derived from the natural movements of the hand. They are based on the ellipse and its segments, which are the most comfortable and rapid shapes for the human hand to make. The basic elements of the **Gregg Notehand Symbols** include:

- **Forward Slant:** All symbols are written with a slight forward slant, which promotes a smooth, flowing motion and prevents the hand from tiring.

- **Light and Heavy Strokes:** The system uses light and heavy (shaded) lines to distinguish between similar sounds. For instance, a light stroke might represent a 't' sound, while a heavy stroke of the same shape represents a 'd' sound.
- **Length:** The length of a curve or line is also significant. A short curve might represent a short vowel sound, while a longer curve of the same shape represents a different sound entirely.
- **Position:** The position of a symbol relative to the line of writing (above the line, on the line, or through the line) carries meaning, often indicating a vowel sound or modifying the consonant.

These four variables—slant, shading, length, and position—combine to create a highly efficient system where one simple stroke can represent an entire syllable or even a complete word.

## Understanding the Basic Stroke Families

To make the **Gregg Notehand Symbols** easier to learn, they are grouped into families based on their shapes. This is a cornerstone of the system's pedagogy. Once you learn the shape family, you can quickly learn all the related sounds. The major families include:

- **The Curved Strokes (K, G, R, L):** These are the most common symbols. A large, forward curve represents 'K' and 'G' (differentiated by shading), while smaller curves represent 'R' and 'L'. The 'R' stroke is one of the most frequently used symbols in the entire system.
- **The Straight Strokes (T, D, P, B):** These are short, straight lines written at a specific angle. 'T' and 'D' are grouped together, as are 'P' and 'B'. Again, a light stroke indicates the unvoiced sound (T,

## Gregg Notehand Symbols

P), and a heavy stroke indicates the voiced sound (D, B).

- **The S-Circle and S-Loop:** The /s/ sound is represented by a tiny circle. This small **Gregg Notehand Symbol** is incredibly versatile. It can be added to the beginning or end of any other stroke to create words like "see," "say," "us," or "yes." Similarly, the /ses/ sound (as in "classes") is represented by a small loop.
- **The H-Stroke and Y-Stroke:** The 'H' sound is a tiny dash, and the 'Y' sound is a small, downward curve. These simple symbols allow for the smooth joining of many common words.

By learning these families, a student can quickly begin writing real words and sentences. The logic is consistent, which dramatically reduces the memorization burden.

### Brief Forms: The Highway to Speed

While the basic alphabet of **Gregg Notehand Symbols** is efficient, true speed comes from the use of "brief forms." These are abbreviations—very short, one-stroke symbols that represent common, frequently used words. Learning the brief forms is where the system truly shines, as it allows you to write entire phrases in just two or three strokes. Some examples of brief forms in Gregg Notehand include:

- **a / an / and:** Written with a single short dash.
- **the:** A single downward curve.
- **of:** A small upward curve.
- **to / too / two:** A single forward slant.
- **I:** A short, heavy downward stroke.
- **you:** A small, forward curve.
- **will / well:** A single downward loop.

These brief forms are not just arbitrary symbols. They are derived logically from the full strokes for those words. For instance, the brief form for "will" is a shortened, looped version of the 'W' symbol. Because these words appear so frequently in spoken and written English, mastering just 50-60 brief forms can triple your note-taking speed when using **Gregg Notehand Symbols**.

### Joining Rules: Writing with Fluidity

One of the most elegant features of the system is the way symbols join together. The **Gregg Notehand Symbols** are designed so that they flow into one another without lifting the pen. This is a key difference from systems like Pitman Shorthand, which require frequent pen lifts. The joining rules are simple and based on the natural arc of the hand. When a curve meets a straight line, or a curve meets another curve, the transition is always smooth. This "joined-up" writing is what gives Gregg Notehand its characteristic aesthetic—a flowing, connected script that looks almost like a foreign cursive language. This fluidity is not just for looks; it is the primary mechanism for achieving high speed without causing hand fatigue.

### How to Start Learning Gregg Notehand Symbols

If you are intrigued by the potential of **Gregg Notehand Symbols**, the good news is that getting started is easier than you might think. The system was explicitly designed for self-study and classroom use. Here are a few practical steps to begin your journey:

1. **Find a Textbook:** The most important resource is the original textbook, "Gregg Notehand: A Personal-Use Shorthand with Integrated Instruction in How to Make Notes." This book starts from the very beginning and guides you through each symbol family, brief form, and joining rule. Used copies are often available online.
2. **Focus on the Phonetic Principle:** Remember that you are writing sounds, not letters. Practice listening to a word and identifying its core sounds. For example, the word "enough" sounds like "e-n-u-f." This phonetic awareness is the foundation of all **Gregg Notehand Symbols**.
3. **Master the First Family First:** Start with the "K-G-R-L" family of curves. These are the most common symbols. Spend time practicing them until they become automatic. Do not try to learn all the families at once.
4. **Write Slowly, Then Speed Up:** When you first start, write slowly and deliberately, focusing on the correct shape, length, and shading. Speed will come naturally as your hand develops "muscle memory" for the **Gregg Notehand Symbols**.
5. **Practice with Real Content:** Once you have learned the basic alphabet and a few brief forms, start taking notes on simple material. Listen to a short news report or a podcast and try to capture the main ideas using your new symbols. This real-world practice is far more effective than rote copying of lists.

## Common Challenges and How to Overcome Them

Like any new skill, learning **Gregg Notehand Symbols** comes with its own set of challenges. Being aware of these can help you stay motivated. One common issue is the tendency to revert to longhand when you get

tired or when the speaker is very fast. The solution is to start with slow, predictable material and gradually increase the difficulty. Another challenge is learning to "think" in sounds rather than letters. This can feel unnatural at first, but with daily practice, the phonetic processing becomes automatic. Finally, many learners struggle with reading their own notes. This is normal. Reading shorthand is a separate skill from writing it. The best way to improve your reading speed is to go back and read your practice notes aloud, sounding out the symbols. With consistent effort, both reading and writing using **Gregg Notehand Symbols** will become fluent.

## The Modern Relevance of a Vintage Skill

In an age dominated by laptops, tablets, and smartphone apps, you might wonder why anyone would bother learning a paper-based shorthand system from the 1960s. The answer lies in the unique cognitive and practical benefits it offers. Research in cognitive psychology has shown that handwriting, as opposed to typing, leads to deeper processing of information. When you write by hand, you are forced to synthesize and summarize in real time. With **Gregg Notehand Symbols**, this cognitive engagement is amplified because you are not just writing words; you are decoding sound and translating it into a symbolic form. This dual processing enhances memory retention and comprehension.

Furthermore, Gregg Notehand is a **private** form of writing. In a meeting, you can take notes without anyone else being able to read them. It is also a highly **portable** skill—you only need a pen and paper. There is no battery to charge, no Wi-Fi connection required, and no risk of a system

crash. For students who find that typing distracts them from listening,
